Count of Device Model

Count of Operating System
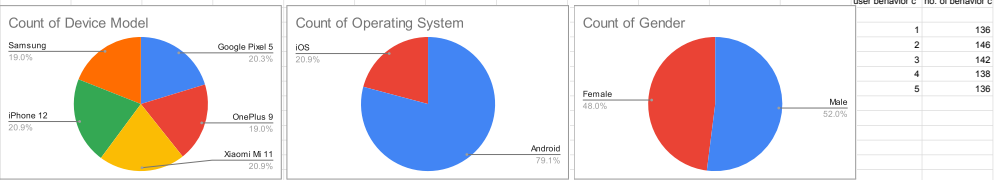

Count of Gender

In regards with on the intended purpose of the data, first and foremost the data can already be concluded to be representative to both sides of the gender spectrum due to the amount of data gathered nearly being equal to both sides. Going forward, it can also be visualized the chosen operating systems by the users preferably used an Android Phone compared to an IOS which, although are not related in the intended purpose of the dataset which is figure out the relationships of a users behavior in regards with device usage, can still be utilize for other studies.

Histogram of Data Usage (MB/day)
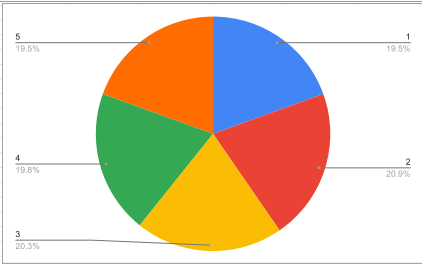

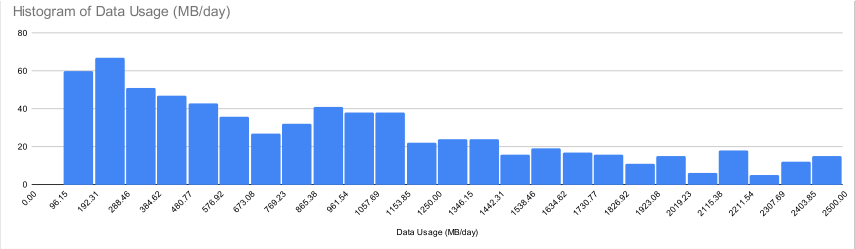

Based on the synthesis of the observed data gathered from the given dataset in correlation with the intended purpose of the given dataset which is to understand the relationship between the mobile usage towards an individual users behavior. In the given data, it can be visualized from the basis of a 5-point likert scale being a basis which categorizes the individual users based on the synthesized data of the users from the 5 variables which is app-usage time, screen-on time, battery drain, number of apps installed, and the data usage most of the users behavior are related or can be summed up to be heavily influenced by their utilization of their mobile devices with ~60% of the total respondents being categorized higher than 3 which indicates that their utilization of their mobile devices are high enough that they have met the criterion of being influenced by them. The concluded data can be backed up as evident with the shown data such as those below a category of 2 having their given 5 variables being lower compared those that is categorized in 3 and above. The difference can be better visualized by looking at those that have gotten a 1 and 5 in their scaling with those in category 5 having more than 7 hrs of app usage time compared to those in category 1 with only 1 and even less than 1 hrs of app usage time.
